**Definition**

Immunology deals with the study of immune system that protects the body from the pathogenic microorganisms or their toxic products or other foreign agents. The Latin term 'immunis' meaning 'exempt' is the source of the English word immunity, meaning the state of the protection from infectious disease.

**Introduction**

The immune system is a remarkably adapting defense system that as evolved in vertebrates to protect them from invading pathogenic microorganisms and cancer. It is able to generate the enormous variety of cells and molecules capable of specifically recognizing and eliminating an apparently limitless variety of foreign invaders. These cells and molecules act together in an adaptable dynamic network.

Functionally an immune response can be divided into two interrelated activities, that is recognition and response. Immune recognition is remarkable for its specificity. The immune system is able to recognize suitable chemical differences that distinguish one foreign pathogen from another. At the same time the system is able to discriminate between foreign molecules and the bodies own cells and protein.

Once a foreign organism is recognized the immune system enlists the participation of a variety of cells and molecules to mount an appropriate response known as effectors response to eliminate or neutralize the organisms. Later exposure the same foreign organisms induces a memory response characterized by a heightened immune reactivity that serves to eliminate the pathogen and prevent disease.

Thus, the term immunity refers to the resistance exhibited by the host towards injury caused by microorganisms and their products. Protection against infectious diseases is only one of the consequences of the immune response which in its entirety concerned with the reaction of the body against any foreign pathogen.

**History of immunology**

Louis Pasteur has contributed much to the field of immunology and all this scientific accomplishments earned him "Father of Immunology".
